Abstract of corresponding document: **EP0326893**

The dishwasher has a spraying system which is fed with cleaning liquid from a collection trough, which has a water inlet valve, by means of a circulation pump, driven by an electric motor. Means are provided for measuring the current input and/or the capacitor voltage and/or the rotational speed of the electric motor or of the liquid pressure and/or the flow rate in the spraying system or the noise level or the vibrations of the machine, which means cause the water inlet valve to close after a minimum filling level of the collection trough has been reached and a uniform measuring value has been obtained.
